## General information

### GetMessageAcknowledgementsStatus

The GetMessageAcknowledgementsStatus method is used to find out which message the user has sent, which recipients have received, viewed or read the message and at what time.

#### Request

This method can only return 100 acknowledgements at a time; consequently, you must call upon it multiple times if necessary.

- Example request

#### Response

The response gives you information about your sent message: who received and read your message and at what time.

- Example response
- Status codes

## Basic flow

Flow	Specifications
